Has AI got its CLAWS in you?

In this
issue

AI is everywhere, transforming how we work and communicate.

One tool in particular could be putting you in serious danger.

What is OpenClaw?

OpenClaw (formerly Clawdbot and Moltbot) is a new kind of AI tool that doesn't just talk to you – it acts for you. You can set it up on your own computer or server and tell it to do things like read emails, manage messages, fill in forms online, send texts, or automate tasks on other apps.

It's like an AI assistant that works in the background doing real jobs for you instead of just answering questions.

It's popular...

150,000 GitHub stars

300,000 users in just two months

OpenClaw is spreading FAST.

The “claws” on OpenClaw could catch you unawares!

It gets deep access to your information

To be useful, many people give OpenClaw permission to see and work with their emails, messages, calendars, files, and other personal data. That means if something goes wrong, a lot of your personal information could be exposed.

Security problems have already been found

Security researchers have seen OpenClaw installations on the internet that weren't protected properly – meaning that other people could connect to them and see sensitive data like login tokens or account keys.

It can run extra “skills” or plugins without checks

OpenClaw can be extended with add-ons (called “skills”) that make it do more things. But many of these add-ons aren't checked for safety – some could steal data or do unwanted actions.

If misused or hacked, it could act on behalf of the user

Because OpenClaw can execute tasks automatically, a hacker who tricks it could make it send messages, access accounts, or perform other actions without the real owner knowing.

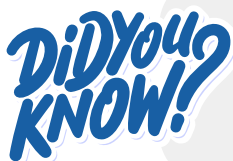

Ordinary security protections don't always stop it

OpenClaw doesn't behave like a normal program that firewalls or security tools easily watch – it talks directly with other systems and services in ways that traditional protections might miss.

So, while OpenClaw is powerful and exciting because it can do things for you, that same power means it needs lots of access to your data and devices. Many of its security protections are weak or missing, so if attackers find a way in, they could access a lot of your private information or make the AI act in harmful ways.

**For now, it's best to handle your emails and appointments the old-fashioned way.
Rather a little extra admin than having your entire life hijacked by cyber criminals.**
